Milestone-3: Performance Trend and Insight Analysis

Objctive:

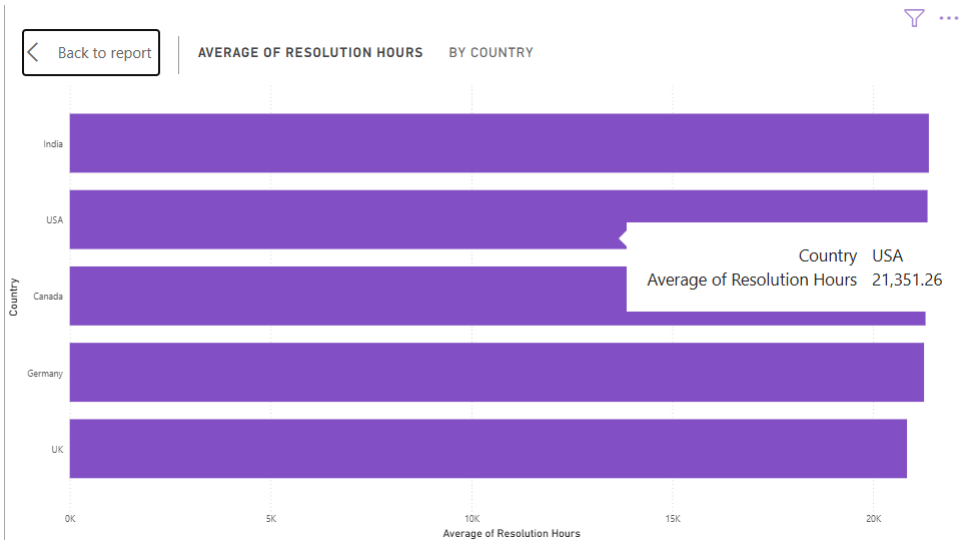
The objective of this milestone is to analyze IT support team performance using ticket resolution data and identify areas for improvement.

Key Analysis Sections:

Resolution Time by Channel:

The analysis shows that resolution time is almost consistent across all channels such as Email, Phone, Chat, and Social Media. This indicates a balanced performance across communication platforms.Ticket Type Performance

Resolution Time by Country:

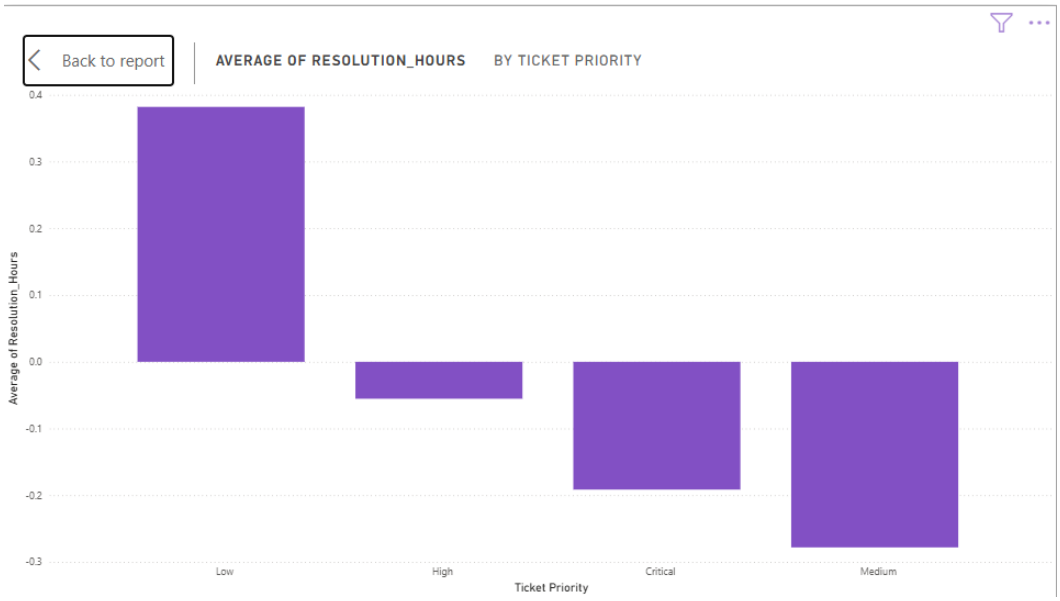


The resolution time across countries like India, USA, Canada, and Germany is very similar, indicating uniform service performance globally. However, slight variations suggest minor regional inefficiencies.

Ticket Distribution by Country:

The number of tickets is evenly distributed across countries, showing that workload is balanced across regions. This helps in maintaining consistent service quality.

Resolution Time by Priority:

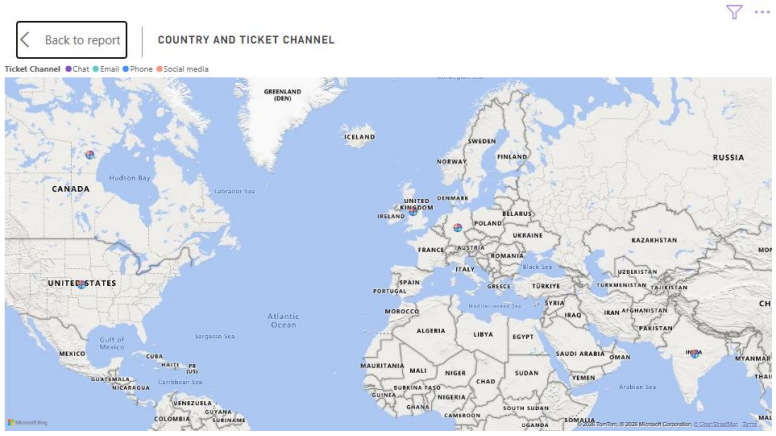


The analysis shows that resolution time does not vary significantly across priority levels. This suggests that high-priority tickets are not being resolved faster than low-priority ones, which may need improvement.

Ticket Count vs Resolution Time:

The scatter plot shows no strong relationship between ticket count and resolution time. This indicates that workload volume does not directly impact resolution efficiency.

Geographic Analysis:



The geographical map shows ticket distribution across different regions including North America, Europe, and Asia. This helps in identifying regional performance trends and workload distribution.

Key Insights:

- Resolution time is consistent across all communication channels

- No major difference in performance across countries

- High-priority tickets are not resolved significantly faster than others

- Some products generate more support tickets

- Workload is evenly distributed across region

Conclusion:

In this milestone, performance trends were analyzed using Power BI dashboards. The analysis revealed key insights about resolution efficiency, workload distribution, and regional performance. These findings will help in optimizing IT support operations in the final stage.
