DATA-DRIVEN OPTIMIZATION OF IT SUPPORT TEAM PERFORMANCE USING ANALYTICS

Project Report

Name: Ashwini P V

Internship: Infosys Internship

Year: 2026

1. Introduction

In today's digital environment, IT support teams are essential for maintaining system reliability and user satisfaction. With increasing ticket volumes and diverse issue types, it becomes important to analyze support data to improve efficiency and service quality.

This project focuses on analyzing IT support ticket data using data analytics and visualization techniques. The aim is to identify trends, evaluate performance, and provide actionable insights to enhance support operations.

2. Dataset Description

The dataset contains detailed information about IT support tickets and includes the following attributes:

- **Ticket ID:** Unique identifier for each ticket
- **Ticket Type:** Category of issue (Incident, Request, Problem)
- **Priority:** Level of urgency (Low, Medium, High, Critical)
- **Category:** Type of issue (Bug, Security, Integration, etc.)
- **Resolution Duration:** Time taken to resolve the issue
- **Region/Country:** Location of ticket origin
- **Similarity Score & Cluster ID:** Used for grouping similar issues

This dataset enables analysis of ticket distribution, resolution efficiency, and performance trends.

3. Modules Implemented

The project was completed in a structured milestone-based approach:

- **Module 1:** Data Acquisition and Understanding
- **Module 2:** Data Cleaning and Feature Engineering
- **Module 3:** Exploratory Data Analysis
- **Module 4:** Cluster and Similarity Analysis
- **Module 5:** Performance Analysis
- **Module 6:** Geographic Insights
- **Module 7:** Dashboard Development

4. Visualizations and Analysis

The project includes multiple visualizations to understand ticket behavior and performance trends.

- **Figure 1: Ticket Type Distribution**

Shows the distribution of different types of support tickets. It helps identify the most common issues handled by the support team.

- **Figure 2: Priority Distribution**

Displays the number of tickets across different priority levels, highlighting workload distribution.

- **Figure 3: Resolution Time Analysis**

Compares resolution time across priorities to evaluate efficiency.

- **Figure 4: Cluster Analysis**

Groups similar issues together using clustering techniques to identify recurring problems.

- **Figure 5: Resolution Duration by Category**

Shows which categories require more time to resolve, indicating complex issues.

- **Figure 6: Total Tickets Overview**

Provides a KPI summary of total tickets handled.

- **Figure 7: Final Dashboard**

Presents an integrated view of all insights including ticket trends, performance, and distribution.

5. Key Insights

- Medium priority tickets form the majority of the workload, indicating that most issues are important but not critical.
- High priority tickets require faster resolution but often show longer resolution times, highlighting potential inefficiencies.
- Certain issue categories such as bugs, integration issues, and service requests occur frequently, suggesting recurring system problems.
- Cluster analysis reveals patterns in similar issues, helping in identifying repeated problems and enabling better resolution strategies.
- Resolution time varies significantly across categories, indicating that some issues are more complex and require specialized handling.
- Geographic analysis shows that some regions or teams perform better in resolving tickets efficiently, while others may need improvement.

6. Conclusion

This project demonstrates the effectiveness of using data analytics to improve IT support team performance. By analyzing ticket data, identifying patterns, and visualizing key metrics, valuable insights were obtained regarding issue frequency, resolution time, and overall efficiency.

The Power BI dashboard provides a comprehensive and interactive view of support operations, making it easier to monitor performance and identify problem areas. The integration of clustering and similarity analysis further enhances the understanding of recurring issues and supports better decision-making.

Overall, this project highlights the importance of data-driven approaches in optimizing support processes, reducing resolution time, and improving user satisfaction.

7. Future Scope

- Implement real-time data integration to continuously monitor support performance
- Apply machine learning models to predict ticket resolution time and issue categories
- Automate handling of repetitive or low-priority tickets using AI-based systems
- Enhance clustering techniques for more accurate grouping of issues
- Integrate the dashboard with organizational systems for better decision-making
- Improve visualization by adding more interactive and drill-down features
